EVALUATION TASK

AI Automation Engineer

Build, deploy, and demo a Forager × HubSpot enrichment automation.

About This Task

This is a practical evaluation task for the **AI Automation Engineer** role. It mirrors the kind of real work you'd do with us: building a data-enrichment automation that connects **Forager** (a data enrichment tool) with **HubSpot**, end-to-end.

We're looking for clean, custom-built engineering — **this must be written in code (Python), not assembled in a no-code tool such as n8n**. Please build it, deploy it so it runs live, and then record a short video walkthrough of the working solution to share with us.

Full Scope of Work

#	Task	Description
1	**Enrich companies**	Pull full company details (description, revenue, headcount, etc.).
2	**Enrich contacts**	Fill in the required contact fields (see field list below).
3	**Find contacts at a company**	Discover new contacts, with the ability to filter / control by job title.
4	**Company webhook automation**	When a new company is added to HubSpot, a webhook fires and the automation enriches that company. If its contacts already exist in HubSpot they get enriched; if they don't, we find them.
5	**Contact webhook automation**	When a new contact is added to HubSpot, a webhook fires and the automation enriches that contact.

Required Fields — Each Enriched Contact

- First & last name
- Person LinkedIn URL
- Job title
- Company name, domain, and company LinkedIn URL (of their employer)
- Email (if available)
- Phone (if available)
- Location / address: city, state, country
- ***Nice-to-have:*** any extra details Forager surfaces, e.g. the person's description and “About” section from their LinkedIn profile. Flag these for discussion so we can decide whether to include them.

Required Fields — Each Enriched Company

Full details including description, revenue, headcount, etc.

Forager Access

> **How to get a key**
> We are going to use **Forager** for this task. You can create your own account on Forager; it gives you **150 free credits**, which is sufficient to execute this task.

Engineering Requirements

- Build it as **custom code in Python** — no-code / workflow tools such as n8n are not acceptable for this task.
- Deploy it somewhere so the webhooks run live; **Railway** works well and is a good default choice.
- Store sensitive variables (API keys, endpoints) in **secure environment variables**, never hard-coded.
- Code should be clean and production-quality.
- For contact-finding, ensure **job-title-based filtering** works — control which people the script surfaces.

Primary Deliverable

> **Focus here first**
> Produce a clean, demo-ready record set we can review:

- Enrich the **OpenAI** (dummy / test) company with all details.
- Enrich **5 people** under it, each with full contact info including email, phone, city, state, country.
- The records must look complete and clean — this set is what we'll review to assess the work.

What to Submit

1. A **video recording** demonstrating the working automation (enrichment running, webhook firing, records populating in HubSpot, job-title filtering).
2. The **deployed service** (e.g. the live Railway URL) and access to your **source code** (a Git repository).
3. The completed OpenAI demo records in HubSpot.
4. Notes on any “interesting extra details” Forager surfaces that we should discuss adding.
